

Bolder or Costly goals into state wasteful climate plan?

Congratulations to Michigan now the 6th most expensive state charging residents an ungodly electric use rate averaging 21.8 cents per kWh. Utility shutoffs are now in the thousands per month, I say well done people. Now all EGLE has to do is convince those cash strapped individuals that all their problems will be solved if only they buy a \$60,000 EV.

One last question for our unbiased Climate & Energy Advisor: Our grid infrastructure is woefully lacking transmission capabilities for the thousands of proposed charging stations. The projected build out of massive wind turbine farms, along with unreliable land eating solar panel gardens threatens thousands of farmland acreage . How exactly does all this increase the affordability, reliability, dependability, sustainability, when billions are needed just to play pretend catch up?

Are we chasing our tails just to be politically correct while wearing blinders? The handwriting is on the wall but sadly those in power refuse to read it.
